

WHAT THIS DOES

Give Claude a high-rise address. It returns a ranked shortlist of comparable rental buildings, you pick the set, and it verifies every unit's interior SF against sources it opens that session and delivers an institutional comp workbook.

BEFORE YOU START — 4 REQUIREMENTS

1. **Claude desktop app with Cowork mode.**
2. **Claude in Chrome extension installed; Chrome open and connected.**
3. **SIGNED IN to BOTH condos.ca (leased history) AND vipcondos.toronto.net (floor plans / key-plates)** in that Chrome profile — if either is logged out, the pull fails at step one.
4. **Access to the GitHub repo (private — ask Ata for a collaborator invite):**
github.com/ata2saucy/highsirse-Claude-co-work-tool

SET UP — ONCE, ~5 MINUTES

1. **Download the repo:** Code > Download ZIP (or git clone), unzip into a folder, e.g. `~/Documents/Claude/Projects/comps`.
2. **In Cowork, SELECT THAT FOLDER.** CLAUDE.md in the folder root auto-loads as the operating contract — this is what runs the process; the GitHub link alone does nothing at runtime.
3. **Check the folder has:** CLAUDE.md · the method doc · v2 hickory mock comp.xlsx (template) · building_memory/.

RUN IT

New subject: say “comps for {address}” e.g. “comps for 1736 Weston Rd”

Existing workbook: say “fix the {building} comps” e.g. “fix the hickory comps”

Claude confirms the building, searches the area, then STOPS and shows a ranked shortlist plus every rejected building with reasons. You pick the comp set — no units are pulled before your pick. It may ask once for subject parameters (unit-mix weights, premium, prior-model peg); answer or accept defaults — they stay as yellow levers in the workbook.

You get: {Building} Rental Comps_vACTIVE.xlsx — matching v2 hickory mock comp.xlsx CELL-FOR-CELL: 6 sheets (Output w/ premium framing, unit-mix table, regression + TRREB · Subject & Conclusion · Building Summary · Data_Summary levers · Raw Data colour-coded · Floor Plans), live formulas, zero errors + a verification .md naming every source opened + refreshed building_memory/.

ACCEPTANCE TEST — RUN THIS ON FIRST USE

1. **Fresh folder + new Cowork session > say “comps for 1736 Weston Rd”.**
2. **PASS = it stops at a shortlist and waits for your pick. FAIL = it starts pulling units unprompted.**
3. **After the run: workbook layout matches the mock; zero formula errors; every Raw Data row has an MLS# + listing URL + description; \$/SF = rent ÷ SF on every row; parking adjustment is a live LINEST, not typed.**

HARD RULES — exact interior SF or blank · every number names a page opened that session · no downloads · no new logins or paid records

Governing docs: CLAUDE.md (contract — wins on conflict) · `condo_sqft_verification_method_1.md` (method) · v2 hickory mock comp.xlsx (template)

Worked examples in repo: Hickory Tree Tower (Weston) · Olive Residences. Questions: aardakani@arkfield.com
