

Rental Comp Tool — One-Page SOP

Address in → shortlist → user picks → verified comps → institutional workbook. Governing docs: CLAUDE.md (contract, wins on conflict) · condo_sqft_verification_method_1.md (method) · HANDOFF.md (setup). Updated 2026-06-11.

1. Setup (once)	Cowork + Claude in Chrome connected; signed in to BOTH condos.ca and vipcondos.toronto.net in that Chrome profile. Clone the repo into a local folder and select it in Cowork (CLAUDE.md auto-loads). Full detail: HANDOFF.md.
2. Kickoff	New subject: “comps for {address}”. Existing workbook: “fix / redo the {building} comps” (intake comes from the workbook — don’t re-supply it).
3. Identity (Step 0)	Subject confirmed on vipcondos via the on-page search box — never a guessed URL. building_memory/ checked first (map, not proof).
4. Shortlist — GATE	Area searched (vipcondos Nearby Market + condos.ca neighbourhood). Ranked shortlist (vintage · product · proximity · rental depth) PLUS every evaluated-and-excluded building with reasons. STOP — the user picks the comp set. No per-unit pulls before the pick.
5. Per-unit pull	For each selected building: leased history (login-gated; signed-in session), every unit page opened this session — exact interior SF, never a bracket, never a guess. “Cannot verify” = valid outcome.
6. Cross-check	Five cumulative criteria: bracket (optional) · beds (den-aware) · baths · terrace/balcony · exposure as decisive tie-breaker. Floor-band rule respected; ambiguity → REVIEW, not a number.
7. Workbook	v2 format EXACTLY, six sheets: Output · Subject & Conclusion · Building Summary · Data_Summary · Raw Data (A:AN) · Floor Plans. Live formulas; parking adjustment is a live LINEST regression, never a typed number. Per-subject levers (yellow): date filter, premiums, unit-mix weights.
8. Colour code	Blue font = hard-coded input · black = formula/label · yellow fill = tunable lever. Raw Data confidence fills: green = leased in-window + SF verified per-unit · cream = active/older/caveat · orange = excluded partials.
9. Verify	Recalc to zero formula errors; \$/SF = rent ÷ SF on every row; averages and weighted blocks tie to an independent recomputation; TRREB table only from the report read that session — blank beats invented.
10. Close out	Verification .md written (every source named + what was seen); building_memory/ updated (stable facts only, never reportable SF); coverage summary by tier; data ceiling named (declaration / MPAC / developer schedule).

Hard rules: exact interior SF or blank · every number names a page opened that session · no downloads · no NEW logins beyond your existing vipcondos + condos.ca sessions / no paid records · no per-unit pulls before the user confirms the comp set.
